

SIGNS YOUR HVAC SYSTEM NEEDS REPAIR

1

WEAK OR INCONSISTENT AIRFLOW

Poor airflow could indicate clogged filters, ductwork issues, or a failing blower motor.

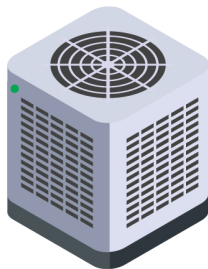

2

UNUSUAL NOISES FROM THE UNIT

Banging, rattling, or screeching sounds may signal loose components, a failing motor, or compressor issues.

3

FREQUENT CYCLING ON AND OFF

If your system turns on and off too frequently, it could be due to thermostat malfunctions or dirty condenser coils.

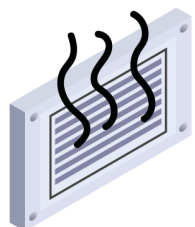

4

UNEXPLAINED INCREASE IN ENERGY BILLS

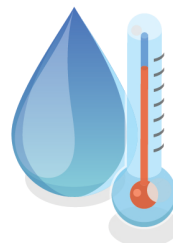

A sudden spike in your energy bill may mean your system is working harder due to inefficiency.

5

UNPLEASANT ODORS COMING FROM THE VENTS

Musty, burning, or foul smells could indicate mold growth, electrical issues, or dirty air filters.

6

EXCESS HUMIDITY OR LEAKS AROUND THE UNIT

Moisture buildup or leaking water could mean a clogged drain line or refrigerant leak.
